In today’s world, High Performance Computing (HPC) is an essential technology for government institutions, universities, and commercial enterprises to solve complex problems in areas ranging from life, earth, and space sciences, to engineering and manufacturing, to national security.

SGI is a global leader in HPC and has been equipping customers with advanced, innovative solutions for over 20 years. SGI ICE is SGI’s flagship scale-out platform and when combining speed, scale, and efficiency, provides the most powerful distributed-memory supercomputer in the world.

Key Features
To address the increasing size and volume of HPC workloads, SGI has developed a 6th generation supercomputer, SGI ICE XA. Extending SGI’s technology leadership, ICE XA enables scientists, researchers and engineers to achieve and accelerate computational breakthroughs at Petascale and with high return on investment.

• Fully leverage leading commercial applications as well as in-house developed codes using industry-standard, state-of-the art x86, Linux, and integrated InfiniBand technologies

• Enjoy optimum flexibility in processor and accelerator mix, blade and storage configuration, and network topology to meet specific workload requirements

• Reduce operational costs through superior power and cooling efficiency coupled with advanced SGI software for system, health and power management

• Power up and be production-ready in hours to days, not weeks to months

• Grow existing ICE clusters by adding next generation nodes and without user interruption

• Capitalize on SGI’s path to Exascale and continuing innovation to solve Terascale and Petascale problems

All ICE XA supercomputers are fully integrated and tested prior to leaving SGI’s U.S.-based factory. And for solution design to include Lustre-based storage and intelligent data management, installation, and system support with 24x7 remote monitoring, SGI Professional and Support Service teams are truly the best in the industry.
**Speed**

SGI ICE XA is designed to run complex HPC workloads at petaflop speed. Compute nodes feature the Intel® Xeon® processor E5-2600 v3 series - SGI's expertise in maximizing Xeon performance is reflected in successive world records to include SPEC MPI2007 benchmarks for the Xeon® E5-2600 v3. Nodes can be further augmented with Intel® Xeon Phi™ Coprocessors or NVIDIA® GPU Accelerators. In addition, SGI Application Engineers have extensive expertise tuning systems to specific workload environments. What matters most is that SGI's performance leadership extends from the laboratory to customer sites, which utilizing pure Intel Xeon®, InfiniBand and Linux technology includes the most powerful commercial supercomputer in the TOP500.

**Advanced HPC Software Accelerates Workloads**

Behind the blazing speed of SGI ICE XA lies innovative hardware coupled with advanced HPC software.

- **SGI Performance Suite** provides a variety of application acceleration components including specialized libraries, plus a high performance MPI environment.

- **SGI Development Suite** provides an advanced software environment for developing, debugging, and analyzing performance of technical computing applications.

- **SGI Management Suite** is a comprehensive suite of tools for high speed system provisioning, proactive health management, and power resource management at a node level.

**Scale**

Grow Seamlessly with Extreme Density

SGI ICE XA can provide up to 191 teraflops of pure compute per rack and grow to tens of thousands of nodes with minimal increase in system overhead.

**Blade, InfiniBand Topology, and OS Flexibility**

The highly differentiated architecture of SGI ICE XA provides optimum flexibility in system configuration.

- **Compute Blade**: Choose from two blade types. The IP-125 is a quad node compute blade with 2-sockets per node (total 8 sockets), delivering maximum Intel Xeon® processor capabilities. The IP-139 is a dual node compute blade with 2-sockets per node (total 4 sockets), coupled with HDD/SSD drives or PCI-e slots to jointly increase processing and I/O capabilities. Both blades can also utilize an innovative cold sink technology to provide high node density at proper heat levels.

- **Blade Enclosure**: 10.5U blade enclosures provide power, cooling, system control, and network fabric for up to 9 compute blades via an integrated midplane. ICE XA can be expanded by simply adding enclosures, with up to four blade enclosures in a single 42U high rack. The enclosure is also designed to support future blade technologies.

- **InfiniBand Topology**: SGI ICE XA utilizes industry standard InfiniBand networking – preferred by half of the Top500 sites and growing – with complete flexibility in topology. Choose from All-to-All, Fat Tree, Hypercube, or Enhanced Hypercube fabrics with single or dual plane (separate MPI and IB traffic) to best meet performance, system size, budget, and application needs.

- **Operating system**: ICE XA runs standard SUSE® Linux Enterprise Server, Red Hat® Enterprise Linux®, or CentOS. Different Linux operating systems can be provisioned on different nodes, thereby allowing a broad range of Linux-based HPC applications to run simultaneously. SGI is one of the largest contributors to the Linux community and brings deep expertise deploying and optimizing Linux systems.

**Scale Out Live with Next-gen Technologies**

SGI's ICE platform features “Live Integration” whereby systems can be expanded using next generation processors, accelerators, and Infiniband networking, and without interrupting users. This highly valuable capability has been demonstrated best at NASA's Ames Research Center, whereby eighteen live platform upgrades spanning five generations of ICE innovation has avoided over a million hours in planned downtime.
Efficiency

Cutting-Edge Power and Cooling

Energy efficiency and green computing is an increasingly important requirement for supercomputers, and for which SGI has been a principal innovator and champion for many years to include:

- Industry-leading Megaflops per Watt for x86 platforms
- Top 4 out of 5 Most Efficient Supercomputers in Top500

ICE XA extends SGI’s leadership in power and cooling efficiency with:

- New E-Cell design: Featuring 2nd generation SGI Cell technology, ICE XA systems are deployed as E-Cells. Two compute E-racks and a unified cooling rack are placed in a sealed E-Cell, with multiple cells connected to form large systems. A cooling rack within the cell draws hot air via an air-to-water heat exchanger and recirculates it to cool the compute racks. This “Closed-Loop Airflow” ensures no air from within the cell is mixed with data center air. In addition, the cell is always water-cooled.

- Warm water cooling: The E-Cell utilizes facility-supplied water for cooling and will not add any heat to the data center if the water temperature is within 45-90 degrees Fahrenheit (7-32C). This high 90F “Room Neutral” water temperature is often 30% or more efficient than industry competitors and can save millions in cooling costs. An air-to-water heat exchanger is provided with all E-Cells, and a water-to-water heat exchanger is deployed when cold sinks are utilized in the compute and switch blades.

- Power supply efficiency: Each blade enclosure in an E-rack is configured with up to 9 power supplies and supports N+1 power redundancy. The number of loaded power supplies can also be controlled so as to not draw unnecessary power and waste energy. The highly efficient design enables ICE XA to achieve a 94% power distribution at 50% load using 80 PLUS Platinum.

Path to Exascale

Regarded as the next frontier in high performance computing, SGI is on a path to deliver supercomputers capable of an exaflop by 2020. Managing power consumption at a job level, utilizing higher facility water temperatures and full liquid immersion, and bringing high-speed SSD storage close to processors to accelerate I/O and reduce power consumption are among many areas of continuing innovation. While these ICE platforms will be built for only the largest of HPC environments, SGI’s Exascale technology will extend broadly to solving compute problems at Tera- and Petascale.
### Compute Blades

**IP-125CS**

- Processors: Intel® Xeon® Processor E5-2600 v3 Series
- Compute Nodes/ Blade: Four 2-socket CPU nodes
- Memory/ Node: 64-512GB/node; 8 DDR4 DIMM slots (4 per CPU socket)
- Memory Capacities: 8, 16, 32 and 64GB 2133 MT/s ECC Registered DIMMs
- Coprocessor/Accelerators (optional): Not Applicable
- I/O (optional): Up to 8 Low Profile IO Cards (Infiniband, Fibre Channel, Ethernet 1,10 & 40Gb)
- Storage (optional): Up to eight 2.5” SATA drives (HDD or SSD) per blade
- Mezzanine Card: Single or Dual Port FDR Connect-IB
- Cooling: SGI ColdSinks
- Topologies Options: Single or dual plane all to all, fat tree, hypercube and enhanced hypercube

**IP-199CS**

- Processors: Intel® Xeon® Processor E5-2600 v3 Series
- Compute Nodes/ Blade: Two 2-socket CPU nodes
- Memory/ Node: 64-512GB/node; 8 DDR4 DIMM slots (4 per CPU socket)
- Memory Capacities: 8, 16, 32 and 64GB 2133 MT/s ECC Registered DIMMs
- Coprocessor/Accelerators (optional): Not Applicable
- I/O (optional): Up to 8 Low Profile IO Cards (Infiniband, Fibre Channel, Ethernet 1,10 & 40Gb)
- Storage (optional): Up to eight 2.5” SATA drives (HDD or SSD) per blade
- Mezzanine Card: Single or Dual Port FDR Connect-IB
- Cooling: SGI ColdSinks
- Topologies Options: Single or dual plane all to all, fat tree, hypercube and enhanced hypercube

### Blade Enclosure

**Integrated Switch**

- Standard: Single 36 port FDR IB ASIC with 18 ports external
- Premium: Dual 36 port FDR IB ASIC with 36 ports external

**Administrative Network**

Dedicated GigE network (redundancy optional), chassis management controller

**Storage**

InfiniteStorage InfiniBand Solutions

- High performance shared file systems
- IP over IB
- Native IB block level access
- Native IB SAN supported with CIFS

**Racks**

D-Rack (For I/O & Support Nodes)

- Specifications: 89.6"H x 24.0"W x 48.0"D. Room neutral up to 32°C datacenter supply water

E-Rack (For Compute Nodes)

- Specifications: 89.6"H x 24.0"W x 48.0"D. Room neutral up to 32°C datacenter supply water

**Blade Enclosure Support**

- n/a - used for I/O & support nodes
- To up four blade enclosures (36 logical nodes each)

**Power**

- Single and three-phase PDUs
- Up to 8+1 redundant 3000W power supplies per blade enclosure

**Cooling**

- Open-looped airflow or water (optional)
- Closed loop airflow/water

### System Management

**HSM**

- Tier 1: System Administration Controller
  - One per ICE system
  - Supplies out software to RLC
  - Pulls aggregated cluster management data from RLC
- Tier 2: Rack Leader Controller (RLC)
  - One per eight blade enclosures (two E-Racks)
  - Holds blade boot images
  - Runs fabric management software
  - Aggregates cluster management data for rack
- Tier 3: Chassis Management Controller
  - One per enclosure
  - Controls master power to all compute nodes
  - Monitors power and blade enclosure environment
- Tier 4: Baseboard Management Controller
  - One per compute node
  - Controls board-level hardware
  - Monitors compute node environment

**Service Node Options**

- Login Node
- Gateway Node
- Batch Node
- Storage Node
- OGS Node
- MDS Node

**System Software**

- BUSE® Linux/Enterprise Server 11
- Red Hat® Enterprise Linux 6

**Cluster Solution Stack**

- SGI Foundation Software 2: Optimized drivers and system monitoring
- SGI Management Suite: Cluster management software
- SGI Performance Suite: Optimized application performance package consisting of SGI Accelerate, SGI MPI, SGI REACT and SGI UPP
- Altair® PETSc Professionals®, Job scheduling and workload management

### Software Development

**Programming Languages and Debuggers**

- C & C++: Intel® C++ Compiler, GNU GCC
- OpenMP: SGI OpenMP included with Intel® compilers, GNU GBD, Rogue Wave Software® TotalView® Team, Allinea DDT, Intel® Inspector XED
- Fortran: Intel® Fortran Compiler (Fortran95), GNU-GCC (Fortran77)
- Performance Analysis: Intel® VTune Amplifier XE, Intel® Trace Analyzer & Collector

**Libraries**

- SGI MPI
- OpenMP included with Intel® compilers
- Intel® Math Kernel Library
- Intel® Parallel Building Blocks
- Intel® Integrated Performance Primitives
- Intel® MPI Library

### For More Information

For more information about how SGI ICE XA can benefit your organization, visit www.sgi.com or call 1-800-800-7441.
